

COMMUNICATION-MEMORY MISMATCH

relevance and a real-but-untrusted source are not authorization

1 • Context mismatch (cross-run)

C4 unbound → serves σ_A → WRONG

acts on a cross-run record (run A $\neq$ B)

C5 bound → denies σ_A (run_id_mismatch)

→ serves only σ_B (run B)

2 • Prompt injection (agent.md)

C4 unbound → executes it → INJECTED

indirect injection via an auto-read file

C5 bound → denies it (integrity flow, Biba)

→ untrusted-derived content not served

C5 binds the active message's context and integrity.
